

## 中國文化大學 99 學年度轉學招生考試

系組：土地資源學系二年級

日期節次：7 月 28 日第 3 節 13:30-14:50

科目：統計學 (149-121)

u-6-4

一、從某班 50 人中抽 9 人，以了解全班年齡的分佈情況，已知這 9 人的年齡為：14, 15, 13, 11, 15, 17, 19, 16, 18；試求下列各值：(40%)

- (a)最大值 (b)最小值 (c) $Q_1$  (d)中位數 (e) $Q_3$   
 (f)平均數 (g)全距 (h)變異數 (i)標準差 (j)變異係數

二、汽車保險公司將駕駛人分成良好、中等、不良風險。申請者被歸於這三類的機率為 30%、50%、20%。良好駕駛人發生意外的機率為 0.01；中等駕駛人發生意外的機率為 0.08；不良駕駛人發生意外的機率為 0.8，若公司賣保險給 A 君，而他出意外，A 君為下列駕駛人的機率若干？(15%)

- (a)良好駕駛人  
 (b)中等駕駛人  
 (c)不良駕駛人

三、一項調查研究顯示：台北地區小學生上學時間呈常態分配，平均數為 40 分鐘，標準差為 10 分鐘，今自該分配抽出  $n=36$  為一隨機樣本，試求：(15%)

- (a) $P(\bar{X} < 35)$  (b) $P(\bar{X} > 42)$   
 (c) $P(38 < \bar{X} < 44)$

四、市政府的消費者保護部門隨機抽驗了 350 罐樣本，得出其樣本平均重量為 310 公克，樣本標準差為 7.5 公克，在 0.01 的顯著水準之下求其信賴水準與信賴區間？(15%)

五、一項有關血液檢驗是否可以發現癌細胞的研究，發展出一種藥劑，當平均分數在 14 以上，可以判定有癌細胞，在 14 以下則視為正常，但是當平均分數等於 14 時，則無法判讀。今將 10mg 的藥劑注入 29 隻白老鼠體內以後，對每隻白老鼠做測試，求得平均分數=14.5，樣本標準差  $S=2.5$ ，請問這種藥劑是否可以有效的檢驗出癌細胞？(假設  $\alpha=0.05$ )(15%)

t-分配右尾百分點  $t_{\alpha}(d.f.)$

標準常態分配值
